

K5 AND K4 GASRINGS

UNDER THE STEERING WHEEL

These additional accelerators help the drivers with lack of mobility to the lower limbs to drive in the cars with automatic transmission or automatic clutch. Something new with **K5**: it gives the opportunity to accelerate by either pulling the ring towards the steering wheel or pushing it down towards the dashboard. The driver can change the driving style, instantly, relating to the road conditions.

The double stroke of the K5 enables the driver to let the hand drop on the brake lever and to push the ring down with the thumb in an easy way. The other hand, which is completely free, can control the steering wheel. In this way the car can be completely safely driven during all manoeuvres.
