

# INDEPENDENT DRIVING

## KIVI PV3000 Hand Control

The transmitter on the wheel or auxiliary controls PV 000 is used by drivers with disabilities to one upper limb. It can be installed in cars with automatic gear and power assisted steering. The transmitter on the wheel or auxiliary controls PV 000 is an infrared device that manages the service controls from one steering wheel either on the right or the left depending on the individual's needs.

The device consists of a key pad and a handle which allow the driver to control the steering wheel with the able limb and to manage direction indicators, windshield wipers (two speeds available), windscreen washer, low and high beam lights, flashing horn and hazard lights. This transmitter is also set up with a button which an optional function can be connected.

The buttons for the auxiliary functions are in relief with respect to the key pad surface so their exact position can be easily found just by moving the hand looking away from the road not even for a moment. Each button is back lit which makes it easier for the driver to find them at night.

### FEATURES

-  Consists of keypad and handle.
-  The buttons on the control pad are back lit.
-  Can be installed for right, or left side application.
-  All auxiliary functions can be activated from the hand control.

### BENEFITS

-  The transmitter is powered by three **AAA batteries**, easily replaceable by the end-user.
-  The keypad can be adjusted to be **fixed** or **revolving**.
